
Gather Coordinates of an element on a page

Created On: January 7, 2022

1. Select the element.

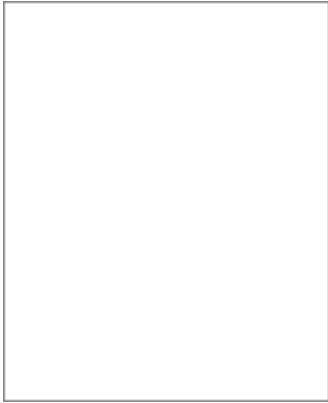

2. Place the element in position 1.

The x and y coordinates are at 79,70. This is going to be position 1.

Write down the position 1 coordinates of 79x,70y.

*Note: Write down the coordinates of each position, so you have the correct coordinates on hand.

3. Select the middle of the page, and we'll move the element in position 2.

4. Write down the position 2 coordinates of 400x and 70y.
-

5. Select the right side of the page, and we'll move the element to position 3.

6. Write down the position 3 coordinates of 700x and 70y.
-

7. Select the left side of the page, to move the element back to Position 1.

8. Note: The Y coordinate will stay the same in all 3 positions if you are setting up the object to move side to side, if you want to move the element up and down the X coordinate will stay the same in all 3 positions.
