# Making Inline Changes to Translation Text

---

Created On: August 26, 2024

1. For this example, we have already imported a translation file to add Spanish to this Project. The translation file had an error, though, and instead of Spanish one of the file's translation cells had the original English text. To start editing this incorrect translated text Select the **Text Element** on the Page.

2. Select the **Translations** option (the world icon).

3. The Edit Translations panel opens. Select the **drop-down list** to see all translated languages.

4. Select **Spanish**.

5. The right area of the panel now shows all text strings associated with the element. The Title row is the name of the element on the page, the Content row is the text displayed within the element. Select **Edit** beside the Content row.

6. The current text for the translated language is displayed. If the edits are minor you can edit the existing text. If the edits are major, you can replace all of the current text. Select the text.

7. With all of the text selected, we'll paste in our new text to replace the current text. In this example, assume we've already copied the replacement text to our clipboard. Press **Ctrl+V** (**Command+V** on Mac) to paste the new text.

## Job Aid Making Inline Changes to Translation Text

---

8. Select **Ok**.

9. The updated text is now displayed in the Content row's Translation column. Select **Ok** to close the Edit Translations panel.
